

ARIMA

There isn't a program dedicated to ARIMA only, but there are many tools and software that support ARIMA as part of time series analysis.

First: ARIMA is not a program

ARIMA is a **mathematical model** within **Time Series Analysis**, not a standalone program.

Meaning:

- Just like Logistic Regression is not a program
- ARIMA is simply a **model / algorithm**

Second: Software & Tools that include ARIMA

1. Programming Languages (most powerful)

- **Python** → statsmodels library
- **Python** → pmdarima library (includes auto ARIMA)
- **R** → arima() function and forecast package

This is the most professional and widely used approach, and the model is ready-to-use

2. GUI-based Statistical Software

If you don't want to code:

- **EViews**
- **Stata**
- **MATLAB**

These programs include:

- ARIMA
- SARIMA

- Forecasting tools
And you can use them without coding
-

Note:

- **X-13ARIMA-SEATS**

This is a more specialized tool for time series (especially seasonal adjustment), but it's still not just ARIMA

Conclusion

- There is **no ARIMA-only program**
- ARIMA is always part of:
 - A programming library (Python / R)
 - Statistical software (EViews / Stata)
 - Full time series analysis systems
